Outline

- Structural differences
- Patent families
- Content differences
- Special indexing

Structural Differences in Patent Resources

Method for reducing incidence of ascites in poultry by aid of **natamycin**

AB

(EP1143805)

Poultry such as chickens and turkeys are treated with **natamycin** to reduce overall mortality and to reduce mortality rates due to the disease ascites.

Protected countries

Granted:  AU,  MY,  PT

Pending:  MX

Structural Differences in Patent Resources

Simple families in our portfolio

Bossa & Vikings

Olive

Extended family

Marta

← Great Grandmother

→ Mother

Structural Differences in Patent Resources

- Structural differences are fundamental to the collections of patent resources
- Many of the systems are hybrids, organized both as family and publication collections

These differences appear in the user interfaces, in exports, and in the APIs of databases

Linking publications to families

- Method 1: linking based on family IDs
- Publications are assigned a family ID number by a publisher (e.g. Inpadoc or Derwent Family Number on Derwent Innovation)
- Records grouped by family ID by an aggregator (e.g. FSORT command on STN)

Linking publications to families

- Method 2: generating simple families
- “Build your own families”
- Need application or priority application number
- Normalize application numbers
- Sort

This technique is suitable for publication level data and simple families

Linking publications to families

- Method 3: linking publications to families
- Leverage the families constructed by publishers
- Normalize publication numbers
- Find the publication in a family and establish a link

Linking families to other families

- Use priority applications or publication numbers
- Normalize
- Build a transitive network linking records

Linking families to families - Strategies

- Link all members from all families
 - Transitive
 - Creates “super families” (union of all definitions)
- Link basic publications into a chosen family
 - Accuracy depends on controlling family being comprehensive
 - Unmatched records need to be handled
- Use extended family information (e.g. VLF IDs on PatBase)

Content differences: publication numbers

- Comparing publication numbers between systems can be challenging
- Number formats (years, leading zeroes)
- Embedded status or office information
- Implied authorities (“6,999,999”)
- Japan
- For some authorities, applications and grants use different serial number series $CNxA = CNxB$

Content differences: family presentation

- Patent Families are presented in fairly standard ways on most platforms
- Publication level collections often simply give a list of members

Content differences: family presentation

- Patent Families are presented in fairly standard ways on most platforms
- Publication level collections often simply give a list of members
- Sometimes family relationships are not exactly clear...
Adis Drug Patents gives a list of US equivalents for non-US patents

Why bother grouping by family?

- Comprehensive: Platforms with different search capabilities, indexing, timeliness
- Integrated: Linking unique content from different sources

Why bother grouping by family?

- Comprehensive: Platforms with different search capabilities, indexing, timeliness
- Integrated: Linking unique content from different sources
- Analytics: Count each family once
- Surveillance: This publication is new, but have I already seen the family?

Content differences: Assignees

- Publishers must decide how to resolve differences between family members
- Varied levels of standardization
- Probable assignees, tracking reassignments
- Some content differences come from the source

At the Patent Office, we have the data we would need to normalize assignee names on the face, but these are legal documents so we can't.

Chris Harrison, IPO 2019 AVM, Nice, France

Content differences: challenges

- Mapping similar content into fields (e.g. titles - original, english, enhanced)
- Choosing among values from different records (e.g. preferring a particular vendor's inventors)
- Taking all values from different records (e.g. building composite patent families)
- Normalization

Content differences: Unique content

- Only rarely does a publisher have unique publications from the patent offices
[Citation required]
- Unique structure (tagging)
- Value-added content (indexing, etc.)
- Application-specific content (e.g. gene sequences)

Content differences

CAS-9 - GenomeQuest, PatBase, DWPI (new STN), FAMPAT

Special indexing

- Many types of indexing are structurally very simple - lists of terms or phrases assigned to a document.
- Controlled vocabulary for indices may come from a complex ontology, but the structure as applied to a document remains simple.

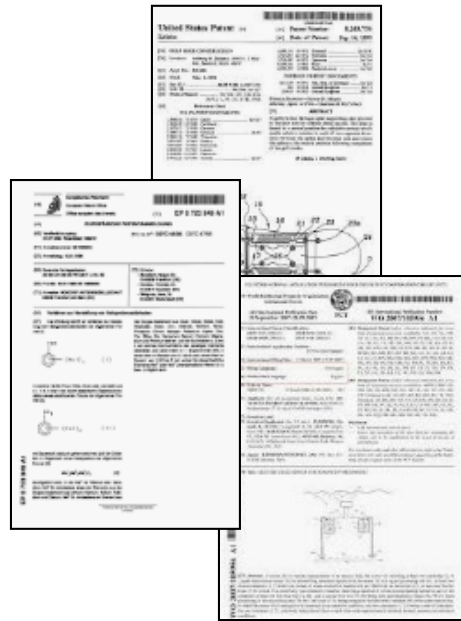

Special indexing - chemistry

- At 2018 PIUG Annual Conference we introduced an Index of Hit Structures from chemical structure searches in REGISTRY / CAplus on STN.

"Exemplified Compounds Table linked to Citing Publications“, Maddy Marley, 2018 PIUG
